Hi,

After graduating, I joined NVIDIA and have spent the past 7 years there in various roles.

Currently, I work in the Denver ARM CPU JIT team. In addition, I am also responsible for Performance tweaking all layers of the Android stack (from the kernel to V8/Mozilla JITs) and driving CPU hardware changes for the same.

Prior to this, I was the Architect of Project Orion, which focused on providing Unified Virtual Memory between cache coherent ARM CPU and Kepler GPU for CUDA programs. Before that, I spent 5 years in the GPU kernel team, specializing in Memory Management, Thread Scheduling, Latency control, Interrupt and was the Kernel Dev Lead for Fermi Architecture.

Outside work, my passion is in Locks, Multi Threading, Parallel Computing and very recently, completed development on a Query Processor (Khronos) that takes in Serial C-like code and Auto-Parallelizes it for Multi Core Execution. Details and other projects along with source at www.pseudoparallel.com

Regards
Kutty Banerjee
